

SMART PHOTO EDITING + OBJECT RECOGNITION + AR APP

2.Workflow of the System

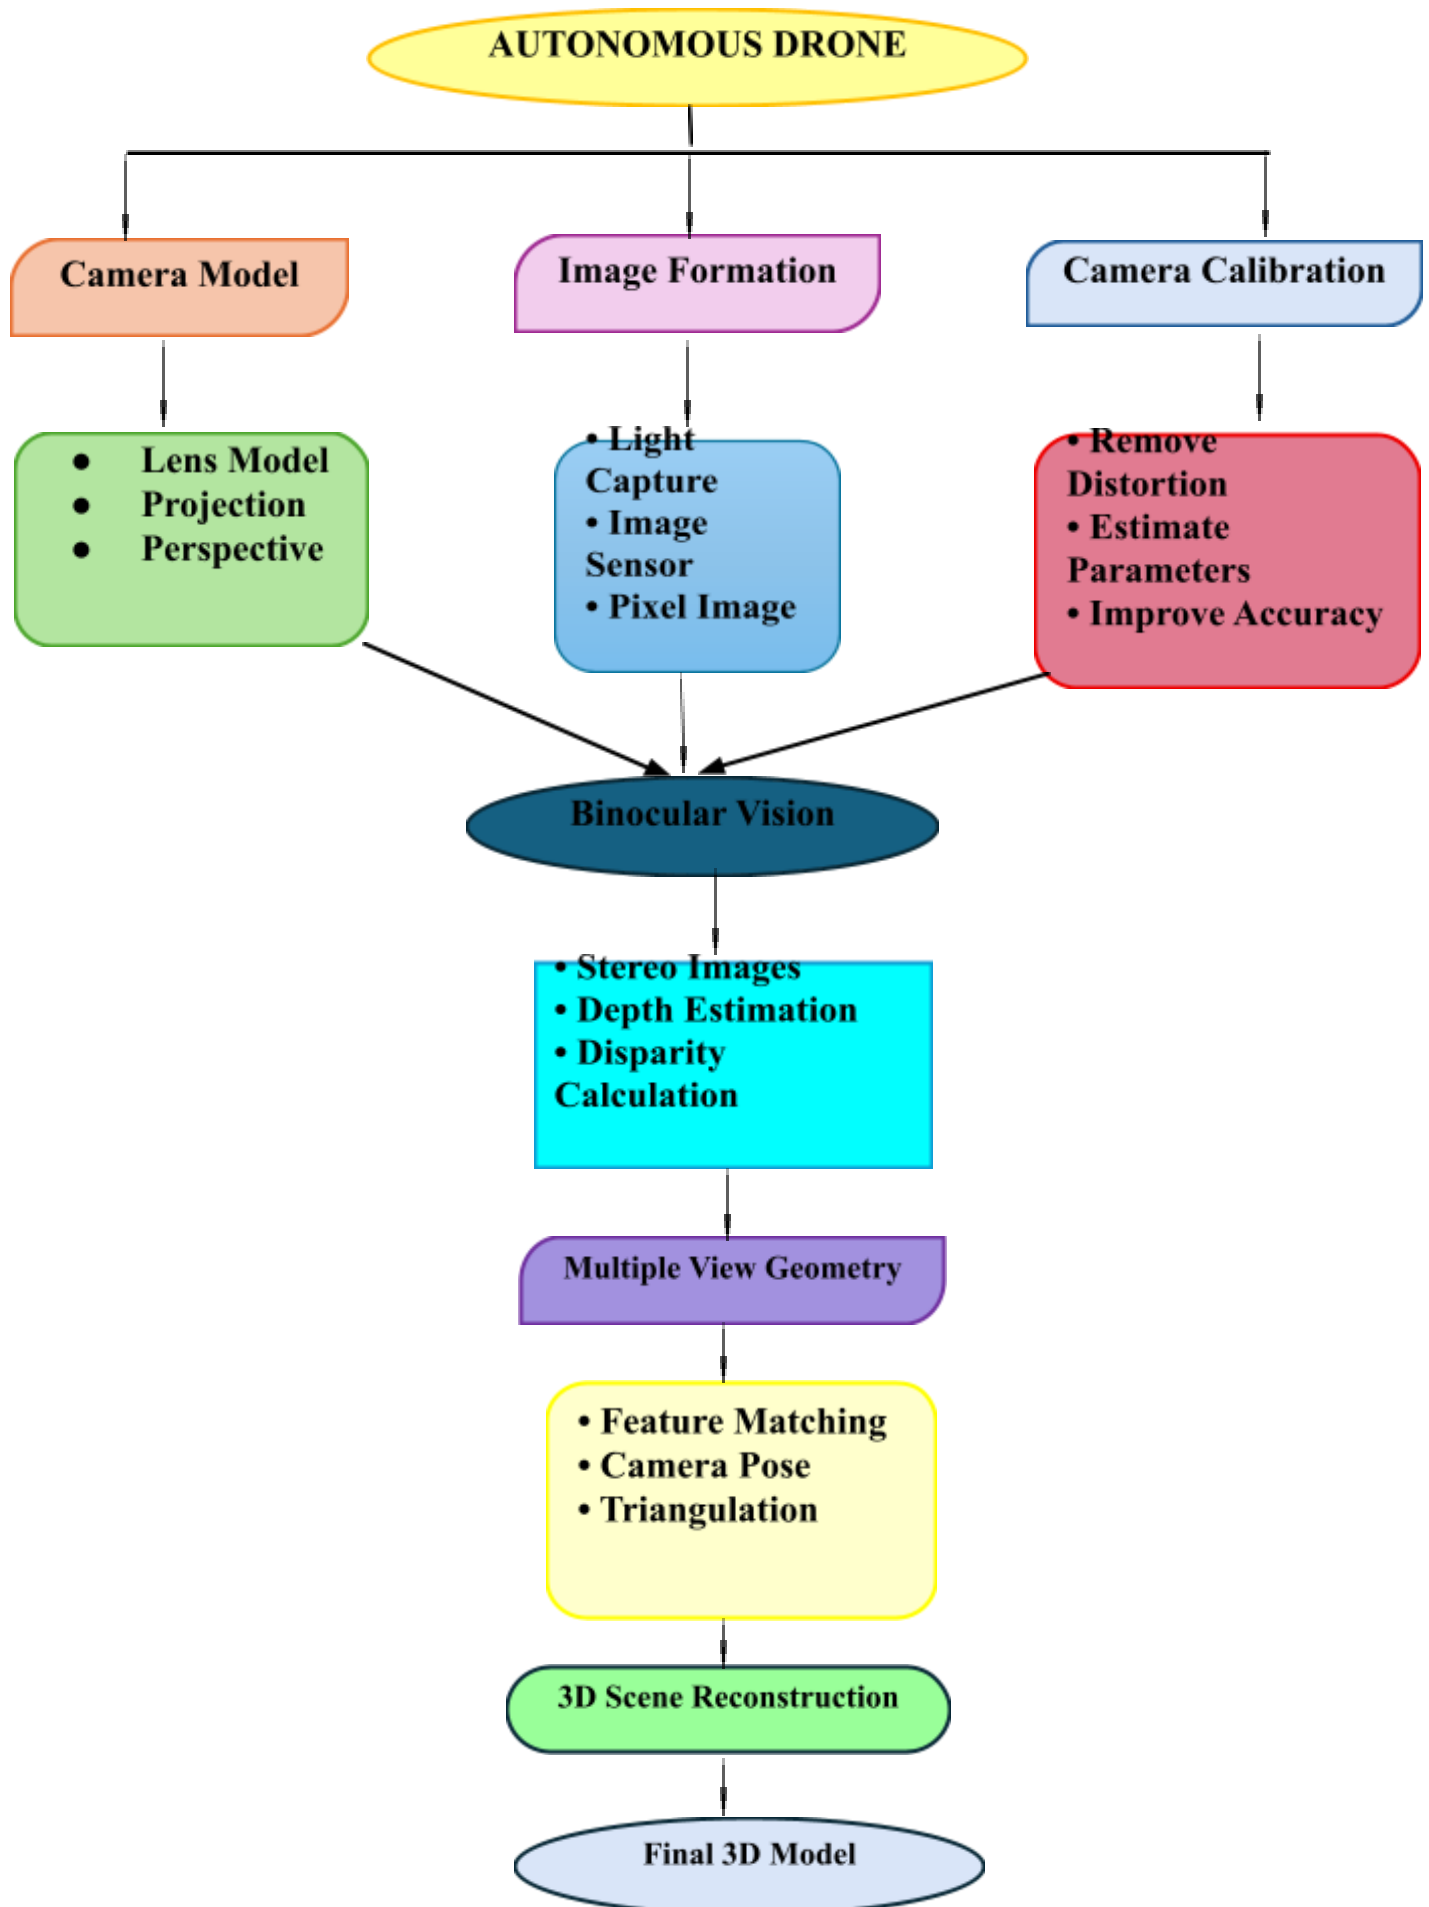

3. Interconnections

- Image Processing improves image quality.
- Computer Vision detects and recognizes objects.
- Computer Graphics creates AR objects.
- Levels of Vision perform image analysis.
- Applications use all modules together.

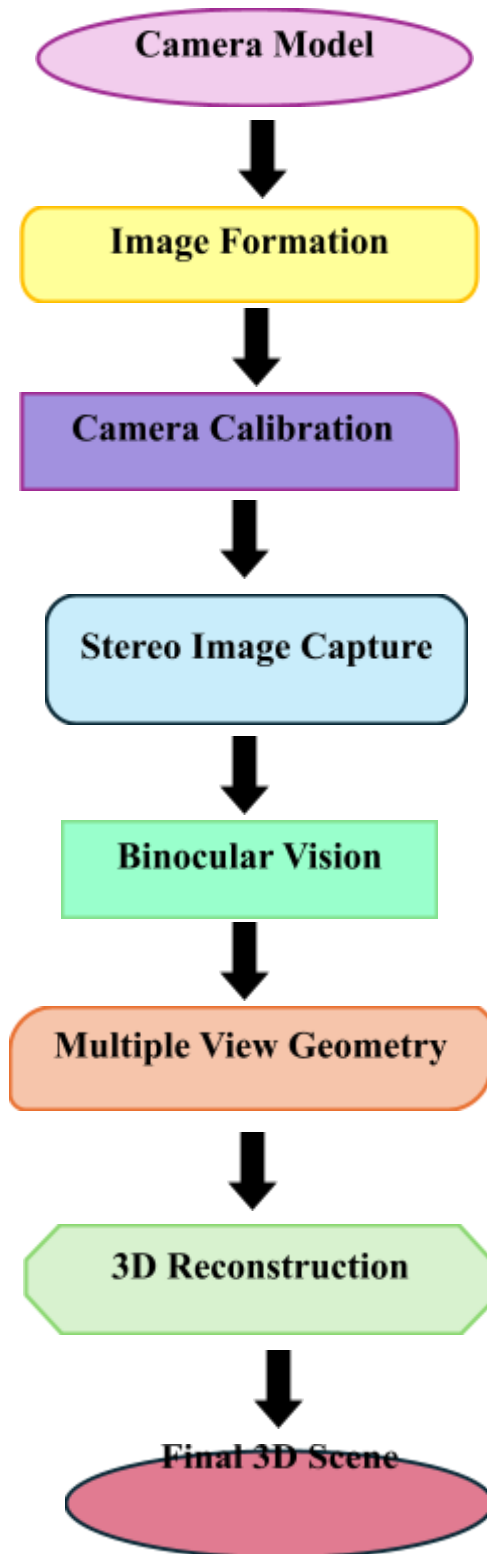

4. Real-world Examples

- Snapchat Filters
- Instagram AR Filters
- Google Lens
- Pokémon GO
- Adobe Photoshop AI

2. Autonomous Drone – 3D Scene Reconstruction

2.Flow of Data:

3.Dependencies:

- Camera Model → Required for Image Formation.
- Image Formation → Provides captured images.
- Camera Calibration → Removes lens distortion.
- Binocular Vision → Calculates depth.
- Multiple View Geometry → Combines multiple images.
- Output → Accurate 3D reconstruction.

4.Output:

- Generates a 3D model of the environment.
- Estimates object positions accurately.
- Measures scene depth.
- Supports obstacle detection.
- Used for drone navigation and mapping.
